ABSTRACT

In this research, we deployed an automated fact-checking system (ClaimBuster) on the 2016 presidential primary debates and assessed its performance compared to professional news organizations. In real-time, ClaimBuster scored the statements made by candidates on check-worthiness, the likelihood that the statement contained an important factual claim. Its discrimination compared to professional journalists was high. Statements chosen for fact checking by CNN and PolitiFact had been scored much higher by ClaimBuster than those not selected. The topics of statements chosen for checking also mirrored the topics of those scored highly by ClaimBuster. Differences between the political parties and individual candidates on the use of factual claims are also presented.

1. INTRODUCTION

Real-time fact checking of important events like political debates remains a challenge for those pursuing it. The first step is to identify the important claims - those that are check-worthy. In this paper, we use all the 21 primary debates for the 2016 U.S. presidential election to compare claims picked by ClaimBuster - our machine-learning based algorithm and system - against the judgments of professional fact checkers at CNN and PolitiFact.

While fact checking has long been a staple of journalism, a competing norm, objectivity, led some news organizations to shy away from contradicting claims made by partisans [9]. The last decade has seen renewed interest in fact checking [11]. Recent research suggests this may have less to do with audience demand than it does with status achievement within the field of journalism [4]. Whatever the cause, research has demonstrated the benefits for news consumers. A study on the 2012 presidential race found that those who visited a fact checking website like PolitiFact were better informed about the race than those who did not [3]. Another study found that consumption of fact checking articles influenced how citizens evaluated negative political ads [2]. A study also found that politicians informed of the electoral and reputational consequences of being fact checked were significantly less likely to receive a negative fact-check rating or have their accuracy publicly challenged [8].

The benefits of fact checking are clear but the number of news organizations with the resources to do it are few. A recent study deemed the practice “quite rare” and found only 3 percent of reporters surveyed using it in their stories [4]. Automated fact-checking tools can be part of the solution [1, 12, 6]. Separating factual claims from opinions and further discriminating between important and unimportant factual claims is our first step in building ClaimBuster. We used it to find important factual claims in the aforementioned 21 primary debates. We also performed topic-detection on the debate transcripts and studied the use of factual claims on the different topics addressed by the Republican and Democratic presidential candidates. We coupled this data with fact checks performed by CNN\textsuperscript{1} and PolitiFact\textsuperscript{2} and then compared the performance of ClaimBuster against these professional organizations.

2. OVERVIEW OF CLAIMBUSTER

ClaimBuster \textsuperscript{3} [6, 5] is a tool that helps journalists find claims to fact-check. While its details can be found in [6], we provide a brief overview of the system in this section.

Given a sentence, ClaimBuster uses a classification and ranking model to determine how check-worthy the sentence is. The model was trained over human-annotated 1960-2012 general election debate transcripts. It uses the tokens in sentences and the tokens’ part-of-speech (POS) tags as the features in the model. ClaimBuster assigns a score between 0.0 and 1.0 to each sentence. The higher the score, the more likely the sentence contains check-worthy factual claims. The lower the score, the more non-factual, subjective and opinionated the sentence is.

Figure 1 is a screenshot of ClaimBuster when it is applied on a debate. The background colors of the sentences indicate how check-worthy they are. Darker colors correspond to higher check-worthiness scores. By default, all sentences having scores higher than or equal to 0.5 are highlighted. A slider allows the user to modify this threshold. An Order by Score button allows the user to order all the sentences by their check-worthiness scores. This way of ranking helps fact-checkers prioritize their efforts in assessing the veracity

\textsuperscript{1}www.cnn.com
\textsuperscript{2}www.politifact.com
\textsuperscript{3}idir.uta.edu/claimbuster
of claims. Thus, ClaimBuster will free journalists from the
time-consuming task of finding check-worthy claims, leaving
them with more time for reporting and writing.

3. PREPARATION FOR THE STUDY

Using the 21 primary debates, we compared ClaimBuster
against the human fact-checkers at several popular fact-
checking organizations. We are interested in testing the
hypothesis that the claims picked by ClaimBuster are also
more likely to be fact-checked by professionals. If the hy-
thesis is true, we can expect ClaimBuster to be effective
in assisting professionals choose what to fact-check and thus
helping improve their work efficiency.

3.1 Data Collection

There have been 12 Republican\(^4\) and 9 Democratic pri-
dary debates in the 2016 U.S. presidential election. The de-
bates featured as many as 11 Republican Party candidates
and 5 Democratic Party candidates at the beginning, re-
spectively. These debates took place between August, 2015
and April, 2016. We collected the transcripts of all these
debates from several news media websites, including Wash-
ington Post, CNN, Times, and so on. There are a total
of 30737 sentences in the 21 transcripts. We pre-processed
these transcripts and identified the speaker of each sentence.
Furthermore, we identified the role of the speaker. Sentences
spoken by debate moderators were excluded from the study
presented in this paper.

3.2 Finding Check-worthy Factual Claims

\(^4\)We only considered the “prime time” debates which in-
cluded the more popular candidates.

We use ClaimBuster to calculate the check-worthiness scores
of the sentences and thereby identify highly check-worthy
factual claims. Figure 2 shows the distributions of Claim-
Buster scores on all the sentences for both political parties.
The distributions for the two parties are similar. One dis-
tinction is that the distribution for the Republican Party
has a higher peak and a slightly thinner right tail than
the distribution for the Democratic party. There are 776
check-worthy factual claims spoken by the Republicans with
ClaimBuster scores over 0.5. This is 5.06% of all the sen-
tences spoken by the Republican candidates. From Demo-
crat candidates, there are 484 (6.73%) sentences with Claim-
Buster score higher than 0.5.

Figure 3 shows the check-worthiness score distributions
for the major candidates (nomination winners and runner-
ups) from both parties. Among these four candidates, Don-
ald Trump appears to have presented less number of highly
check-worthy factual claims (ClaimBuster score ≥ 0.5) than
the other three candidates. He has used more non-factual
claims (ClaimBuster score ≤ 0.3) compared to the other
candidates.

3.3 Topic Detection

From each of the 21 debates, the 20 highest-scoring sen-
tences were selected and manually placed in topic categories,
a modified version of the most important problems (MIP)
used by Gallup and other researchers for decades [7, 10, 13].
The major topics in the primary debates were: economy,
crime, international affairs, immigration, health care, social
issues, education, campaign finance, environment, Supreme
Court, privacy and energy. Some of these topics were fur-
ther broken down into subtopics. The 420 sample sentences
were used to cultivate a list of keywords most often found for
each of these topics. For example, the keywords for subtop-
ics “abortion” were abortion, pregnancy and planned parent-

3.4 Verdict Collection

We used CNN and PolitiFact as the means for comparing ClaimBuster’s results. These two organizations were selected because each identifies claims they judge to be worth checking and then rates each claim on a truthfulness scale. The verdicts for CNN are true, mostly true, true but misleading, false or it’s complicated. PolitiFact uses true, mostly true, half true, mostly false, false and “pants on fire” (egregiously false). Other organizations focus specifically on false or misleading claims only (Factcheck.org) or write about debate statements they found interesting or suspicious (Washington Post) which makes a comparison to ClaimBuster problematic.

For each of the 21 debates CNN and PolitiFact prepared a summary of the factual claims they chose to check and rendered a verdict on them. We collected all of these verdicts, 224 from CNN and 118 from PolitiFact.

Table 1 shows scores given by ClaimBuster to the claims fact-checked by CNN and PolitiFact. The ClaimBuster average for sentences fact-checked by CNN is 0.433 compared to 0.258 for those sentences not selected by CNN, a statistically significant difference. Likewise, the ClaimBuster average for sentences checked by PolitiFact is 0.438 compared to 0.258 for those not selected, also a significant difference. The results of these comparisons demonstrate the utility of ClaimBuster in identifying sentences likely to contain important factual claims.

Figure 4 shows, for each party, the number of fact-checks of different veracity by CNN and PolitiFact. Figure 5 shows number of fact-checks for each major candidates. One observation is, Donald Trump has presented more Pants on Fire, False and Mostly False factual claims than other candidates according to PolitiFact. Similar observation is also evident according to CNN.

4. RESULTS

With the ClaimBuster score, topic and veracity of the sentences at hand, we study the relation among these and try to find answers to questions such as which candidate presented more factual claims pertaining to a certain topic compared to others and so on.

Figure 6 shows the distribution of topics among sentences for each party. Republican candidates are more vocal about
ClaimBuster scored ≤ 0.3. This figure explains how much the candidates spoke about different topics without presenting factual claims. One interesting observation derived from Figures 8 and 9 is that Republican candidates spoke about Health Care but used fewer factual claims regarding this topic. On the other hand, Democratic candidate Hillary Clinton presented factual statements related to Environment rather than presenting non-factual, subjective statements.

Figure 10 shows the topic distributions of CNN, PolitiFact sentences as well as of highly check-worthy factual sentences (ClaimBuster score ≥ 0.5). This figure signifies that there are strong similarities between ClaimBuster and the fact-checking organizations. ClaimBuster tends to give high scores to the topics which CNN and PolitiFact tend to choose for fact checking. For example, all three have about 50 percent of the fact checks (or high ClaimBuster scores) associated with Economy, about 14 percent for International Affairs, about 10 percent for Immigration and 4 percent for Crime. One topic where ClaimBuster showed a difference with the human fact-checkers was Social Issues. That topic represented about 9 percent of the CNN and PolitiFact fact-checks but only about 2 percent of the highly scored ClaimBuster sentences.

5. WORK IN PROGRESS

We look forward to making progress on several fronts in building ClaimBuster in the future. We are applying ClaimBuster on Australian Parliament Hansard. This will facilitate fact-checking statements made by the members of parliament.

Building a repository of fact-checks done by professionals is also in our agenda. This will enable automatic matching of claims during a live event with known fact-checks in the repository and instantly informing the audience about the claims’ veracity.

We are also studying claims found in the media about various domains such as politics, sports and so on. Particularly,
we are interested in investigating how numbers, actions and comparisons are used in factual claims. Furthermore, we will formulate templates of factual claims. Such templates will enable programs to automatically categorize claims, which can be valuable for improving fact-checking accuracy.

All these efforts will bring us closer towards the “Holy Grail” of automated fact-checking - a fully automated, live, end-to-end fact-checking system [5].

6. CONCLUSION

In this study, we used the 2016 U.S. presidential election primary debates to compare the results of our automated factual claim tool against the judgments of professional journalism organizations. Overall, we found that sentences selected by both CNN and PolitiFact for fact checking had ClaimBuster scores that were significantly higher (were more check-worthy) than sentences not selected for checking. On average, the sentences had scores nearly twice the magnitude of the unchecked sentences. At the same time, many sentences scored highly by ClaimBuster were not selected by either organization. Part of this is due to constraints; PolitiFact only checked about 6 or 7 claims per debate, CNN about 10. It may also relate to the nature of the claims, timeliness, uniqueness and other traits. These are areas for further research.

ClaimBuster also compared favorably to CNN and PolitiFact in the distribution of topics among highly scored sentences and fact-checked sentences. The percentage of sentences checked (or highly scored by ClaimBuster) were very similar for topics like Economy, International Affairs, Immigration and Crime. One difference was for Social Issues where ClaimBuster scores were low relative to the fact-checking judgment of CNN and PolitiFact. Understanding the discrepancies will be an area for further refinement of ClaimBuster.
